

Enterprise AI & Microsoft Copilot

Executive Portfolio Summary

Background

Technology professional with 9+ years across Microsoft data, BI, cloud, automation, and enterprise platforms. Recent delivery focus: Microsoft Copilot Studio, Azure AI / Azure OpenAI, RAG and grounded assistants, agentic workflows, Microsoft Fabric, Power Platform, and production ALM with enterprise security and governance—primarily in banking, insurance, and regulatory environments.

Copilot Capabilities

- Grounded enterprise knowledge assistants with citations and access control
- Process automation agents that create requests, validate inputs, and return status
- Agentic orchestration across knowledge, structured data, APIs, MCP, and workflows
- Enterprise RAG pipelines with evaluation for groundedness, relevance, and latency
- Fabric lakehouse foundations for governed analytics and AI consumption
- Security, Purview-aligned governance, and Dev/Test/UAT/Prod ALM

Representative Project Types

Project	Outcome Focus
Enterprise Knowledge Copilot	Verified answers from approved content
Process Automation Agent	Intent → workflow → enterprise action
Agentic AI Workflow	Tool selection with human approval for writes
Enterprise RAG	Measurable retrieval quality and grounding
Fabric + Copilot	Curated Gold data behind BI and AI
AI Security & Governance	Least privilege; no entitlement bypass
Copilot ALM	Repeatable managed-solution promotion

Technology Stack

Copilot Studio · Azure OpenAI · RAG / embeddings / vector search · Power Automate · Power Apps · Dataverse · SharePoint · Microsoft Fabric · Power BI · ADF / Synapse · Databricks · Python · SQL · REST / MCP · Entra ID · RBAC · Purview · CI/CD

Security & Governance

Solutions are designed so agents never expose information or operations beyond the authenticated user’s normal entitlements. Controls include Entra ID authentication, RBAC/RLS, managed identities, Key Vault, DLP, Purview classification, audit logging, connector governance, and environment isolation.

Business Outcomes

- Faster access to governed knowledge with citation-backed answers
- Reduced manual handling for routine service and validation work
- Example impact: Python file-validation process reduced processing from ~3 days to ~10 minutes
- Clearer audit and change-management story for regulated AI releases

Confidentiality: Client-specific implementations, source code, datasets, credentials, internal URLs, and proprietary architecture details are intentionally excluded. Architectures are sanitized reference patterns representing the types of enterprise solutions delivered.
